In addition, we plan to isolate and characterize peptides that are specifically transported by human renal cells. To characterize the receptors for AVP and VIP in human tumor cell lines, we will evaluate the ability of selective analogs of the two amino-terminal peptides (vasoactive intestinal peptide and pituitary adenylate cyclase activating polypeptide) to bind to these receptors, while select peptide analogs will be used to define the boundaries of the receptor binding site. Receptor binding assays will be correlated with rates of tritium release induced by these peptides and selective analogs. We will
